Saveetha Institute of Medical and Technical Sciences
Chennai- 602105

Student Name: A.Virender Singh

Reg. No.:1911260054

Course Code: DSA0101

Slot: D

Course Name: OBJECT ORIENTED PROGRAMMING (OOP) IN C++

Course Faculty: Dr. Parimala Kanaga Devan K

Project Title: LOGISTICS AND SUPPLY CHAIN CARBON FOOTPRINT TRACKING SYSTEM

Module Photographs:

Project Description:

The Logistics and Shipment Information Management Module is a C++-based component designed to efficiently manage, organize, and process information related to the transportation and delivery of goods. The module maintains important shipment details such as shipment ID, sender and receiver information, source and destination locations, package details, weight, transportation mode, delivery status, and estimated delivery information. It provides a systematic way to store and retrieve shipment records, update shipment status, and manage the movement of packages from the source location to the destination. The system can also support different transportation modes such as road, rail, air, and sea, making it suitable for handling various logistics requirements. Using C++ concepts such as classes, objects, functions, arrays or data structures, conditional statements, and file handling, the module provides an organized approach to managing shipment data. It reduces manual record-keeping, improves data accuracy, and allows users to quickly search, update, and monitor shipment information. The module is designed with a simple and user-friendly approach so that logistics information can be managed efficiently while maintaining consistency and reliability. Overall, this module demonstrates how C++ programming and data management concepts can be applied to a real-world logistics and shipment tracking problem, helping improve the efficiency, accessibility, and organization of shipment operations.
